## General

PFM-Total is an application developed by Flucon B.V. to upload, validate and present the data from one or more PFM data-loggers.

To upload data from a datalogger, 3 different modes of communication are possible;

- a direct RS 232 connection (com to com)
- a modem or GSM modem connection
- an Ethernet connection (TCPIP)

PFM-Total can be set up to upload automatically the data during the night.

PFM-Total can be registered for single or multi user applications. In the single user mode the application will use a MS Access database to store and retrieve data, for a multi user application a SQL server or Oracle database is recommended. The application supports any of these databases.

PFM-Total will store the data in the original format (DF format) and in the database. Under General > System > System configuration, the language can be selected (NL, D, Fr, UK or I) and the first day of the week can be set.

## Define location data

Go to the menu General > Configuration > Define Locations

To retrieve a previous configured location, press F5 or click on the binoculars on the toolbar

Location configuration dialog box, General tab. Fields include: Location, Name, Address, Postcode/City, Contact, Phone, Fax, E-mail, Phone no. logger, IP number, Port, File ext., Location code, Datapath (set to \\Win02\belcomputer), SubPath, and connection options (Modem, Local, Modem GSM, Lan). Buttons: New, Delete, Save, Close.

On this first tab, the general information is entered regarding a specific site. The connection type is indicated with the relevant numbers. The location code is the actual number as used by the datalogger on site.

The file type (default \*.PTM), the datapath and other relevant actions during communication are set in this field.

No	Name	From	To
1	Mainstreet	Out	In
2	Station 1	In	Out
3	Station 2	Out	In
4	Allee south	In	Out
5	park 1	Total	house
6	Park 2	house	Total
7	Square	Total	house
8	Square	house	Total
9	Side 1	Total	house
10	Side 2	house	Total
11			
12			
13			
14			
15			
16			
17			
18			
19			
20			

Buttons: New, Delete, Save, Close.

Under the second tab "Sensors", each sensor and direction is indicated. To add or change, click on the relevant button.

Location configuration dialog box, Analysis configuration tab. Fields include: Number of sensors (6), Min. counts (500), Results mail to (Address 1, Address 2). Buttons: New, Delete, Save, Close.

Under the third tab "Analysis Configuration", the application can check the received files and send a result to the indicated addresses. The workstation should be set-up for an e-mail account .

The number of sensors and the minimum counts will allow you to find automatically any failure in one of the sensors. A log is produced during the download of the files and mailed to the selected addresses.

## Define zones

For each location zones must be defined to allow review of the data. The Zone Total, which is the total for the location, must be defined. Additional zones can be configured using the relevant buttons.

Sensorname	Total
Mainstreet (Out -> In)	V
Station 1 (In -> Out)	
Station 2 (Out -> In)	V
Allee south (In -> Out)	
park 1 (Total -> house)	V
Park 2 (house -> Total)	
Square (Total -> house)	V
Square (house -> Total)	
Side 1 (Total -> house)	V
Side 2 (house -> Total)	
11	
12	
13	
14	
15	
16	
17	
18	
19	
20	
21	
22	
23	

Select in the left top corner the relevant location. The Zone Total can not be deleted. For each sensor select the IN direction. If additional Zones are configured, always select the IN direction only.

## Define overviews.

Select General > Configuration > Define Reviews For each aggregation level reports can be defined for each location. Each user with similar log in authority will have the same reports.

Location	Zone	Date
CS Mode Kettering	Total	2 weeks ago
CS Mode Kettering	Total	Last week
CS Mode Kettering	Total	Today

The aggregation levels are; day , week month quarter and year .

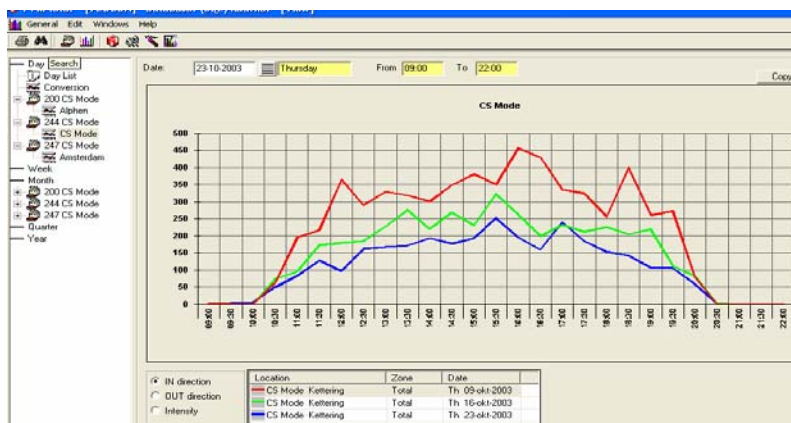

By pressing the correct buttons, views can be added or changed. Select from the screen the location and the configured zone. The start and stop times relate to the X-axis and not filled in the overall setting of the system will be applicable. (see General > System > System configuration)

# Overviews

To review the data, press the graph button and select the required level Each defined view will appear in the list and can be selected. By selecting the correct date the application will retrieve the data from the database and present it on the screen in the predefined format.

An example of a day graph for a specific selection. Within the graph the IN, OUT or INTENSITY can be selected and also the type of graph. The button "copy to clipboard" will allow export of the graph to other programs.

A typical week view as defined under Week.

This selection shows the day totals for the last 6 weeks for a specific object

Av. %	39,6	23,8	31,7	3,7	4,1	100,0

A typical year overview per sensor. The graph can be displayed for IN, OUT, in absolute or percentage values

Location: CS Mode Kettering

Zone: Total

IN direction       Absolute  
 OUT direction       Percentage

## Technical specifications

Application: Visual Basic 6

Operating system: Windows 95, 98, ME, W2000 en XP  
 Preference for Windows 2000 or XP as these platforms will give better access to the database.

Database: Connection to the database by means of ActiveX Data Objects (ADO)  
 The following databases will be supported:  
 Microsoft Access (Standard for single User)  
 SQL server 7 or higher  
 Oracle 8.1.5 or higher
